

AI Tool

Cloud Network Security Advisor

AI-powered security posture analysis · gap detection
hardening recommendations · 90-day action plan

danvzla.github.io/ai-security-advisor

Daniel Mazzini · Principal Architect & Senior TPM

THE PROBLEM

Security architects face the same challenges every engagement

Manual & time-consuming

Security gap analysis done manually takes days. Every engagement starts from scratch with no repeatable framework.

Inconsistent outputs

Different architects produce different assessments. No standardized format for gap analysis or hardening recommendations.

Complex environments

VCF, NSX, SASE, hybrid cloud — modern environments are too complex to assess manually with confidence and speed.

CAPABILITIES

What this tool delivers

Risk Scoring

0–100 risk score with overall risk level: Critical, High, Medium, or Low. Instant executive-ready assessment.

Gap Analysis

Color-coded security gaps table sorted by severity. Each gap includes description and specific remediation action.

Hardening Roadmap

Prioritized hardening recommendations — Immediate, Short-term, Medium-term — with tool alignment per action.

90-Day Action Plan

Phased execution plan with specific actions per phase and timeline — ready to present to customers or leadership.

Excel Export

One-click export to a 4-tab Excel workbook: Summary, Security Gaps, Recommendations, and Action Plan.

Multi-environment

Works across VCF private cloud, hybrid cloud, telco/CSP, financial services, healthcare, and government.

HOW IT WORKS

From input to insight in seconds

1

Describe environment

User describes the network topology, selects current security tools, compliance requirements, and environment type.

2

AI prompt engine

The tool constructs a structured security analysis prompt using the inputs, enriched with domain expertise context.

3

Claude API analysis

Claude claude-haiku-4-5 processes the prompt as a Principal Security Architect and returns structured JSON analysis.

4

Results rendered

JSON is parsed and rendered as color-coded severity tables — gaps, recommendations, and 90-day action plan.

5

Export & share

One-click Excel export generates a 4-tab workbook ready to share with customers, leadership, or audit teams.

System architecture — HLD

PRESENTATION LAYER

- ◆ Browser-based web app
- ◆ HTML / CSS / JavaScript
- ◆ No frameworks — standalone
- ◆ Dark mode support
- ◆ Mobile responsive

AI LOGIC LAYER

- ◆ Input collection & validation
- ◆ Prompt engineering engine
- ◆ Domain context injection
- ◆ JSON response parser
- ◆ Error handling & fallback

AI & OUTPUT LAYER

- ◆ Claude claude-haiku-4-5 API
- ◆ 8000 token output limit
- ◆ Severity-coded tables
- ◆ Excel export (SheetJS)
- ◆ 4-tab workbook output

Single-file deployment · No server required · Runs entirely in the browser · API key stored locally

Data flow & component design — LLD

SAMPLE OUTPUT

What the analysis produces

87

CRITICAL RISK · Overall score: 87/100

The environment exhibits severe security deficiencies including no microsegmentation, legacy VPN with no MFA, and unreviewed firewall rulesets.

5 7 4 12

Critical High Medium Recs

SEVERITY	GAP / RISK AREA	DESCRIPTION	RECOMMENDED ACTION
Critical	No Microsegmentation	NSX deployed but DFW unused. 400+ workloads communicate freely.	Enable NSX DFW. Implement default-deny policies.
Critical	Shared VPN Credentials	No MFA on GlobalProtect. Shared credentials across workforce.	Enforce individual accounts + MFA immediately.
High	Stale Firewall Ruleset	5-year-old rulebase not reviewed. Shadow rules and gaps.	Conduct full audit. Retire deprecated rules.

KEY BENEFITS

Why this matters

15s

Time to full analysis

vs 2-3 days manually

100%

Consistent output format

regardless of complexity

4

Export tabs

ready to share with stakeholders

3

Demo scenarios included

VCF · Telco · Multi-cloud

Enterprise-grade output

Structured JSON output rendered as color-coded tables mirrors the deliverables I produced for Fortune 500 engagements at VMware and Broadcom.

Pre-sales ready

Architects and pre-sales engineers can run a live demo in any customer meeting. The Excel export creates an immediate deliverable to leave behind.

Domain-expert prompt engineering

The tool is prompted as a Principal Security Architect with 20+ years of VMware NSX, vDefend, and SASE expertise — not a generic AI assistant.

DEMO SCENARIOS

Three pre-built scenarios — ready to demo live

01

VCF Private Cloud

Best for: Cisco · Nutanix · VMware-adjacent companies

Environment: Enterprise private cloud (VCF)

Tools: VMware NSX · Traditional Firewall · SIEM

Compliance: NIST CSF · SOC 2

Key gaps: 400+ workloads · No microsegmentation · Legacy VPN · No MFA

02

Telco / CSP Network

Best for: Nokia · Ericsson · Mavenir · Amdocs

Environment: Telco / CSP network

Tools: SD-WAN · SIEM · Traditional Firewall

Compliance: NIST CSF · FedRAMP

Key gaps: 5G core · OpenStack · BSS/OSS exposed · Persistent vendor VPNs

03

Hybrid Multi-Cloud

Best for: AWS · Google Cloud · Microsoft · GSIs

Environment: Financial services / Hybrid cloud

Tools: Traditional Firewall · SIEM · IDS/IPS

Compliance: PCI-DSS · SOC 2 · GDPR

Key gaps: AWS + Azure · No CSPM · Permissive IAM · Unencrypted S3 buckets
